Member 1 — Orchestrator & LangGraph

```
- Set up project folder structure
- Implement Orchestrator Agent
  - Use RAG on routing knowledge base
  - Decompose query into subtasks
  - Route to correct agents
  - Aggregate all outputs into
    final response
- Set up LangGraph graph
  - Define agent state
  - Add all agents as nodes
  - Define routing logic
- Integrate MCP
  - Register all agents as MCP tools
- Write prompt templates
  for all agents
- Connect everything into
  one working pipeline
- Create main.py as entry point
```

Member 2 — Financial & Sales Agents

```
- Collect sample PDFs
```

Claude is AI and can make mistakes. Please double-check responses.

Member 2 — Financial & Sales Agents

```
- Collect sample PDFs
  (financial reports, sales reports)
- Implement Financial Analyst Agent
  - Use shared RAG pipeline
  - Pandas based data analysis
  - Profit/Loss + budget analysis
  - LLM interprets results
- Implement Sales & Data Scientist Agent
  - Use shared RAG pipeline
  - Trend + pattern detection
  - Growth prediction
  - LLM interprets results
- Test both agents independently
- Compare Single LLM vs
  Multi-Agent RAG output
- Expose as simple Python functions
```

Member 3 — RAG Pipeline & Investment Agent

```
- Collect sample PDFs
  (consultant repor strategy docs)
- Build Shared RAG Pipeline
```

+ Sonnet 4.6

Member 3 — RAG Pipeline & Investment Agent

```
- Collect sample PDFs
  (consultant reports, strategy docs)
- Build Shared RAG Pipeline
  (used by ALL agents)
  - PDF parsing
  - Document chunking
  - Embedding generation
  - FAISS/ChromaDB vector store
  - Separate collections per agent
  - Query → Retrieve → Generate flow
- Implement Investment Strategist Agent
  - Use shared RAG pipeline
  - Extract strategic insights via LLM
- Share RAG pipeline code
  with entire team
- Expose as simple Python function
```

Member 4 — Cloud Architect Agent

```
- Collect sample PDFs
```

Claude is AI and can make mistakes. Please double-check responses.

Member 4 — Cloud Architect Agent

```
- Collect sample PDFs
  (AWS/GCP docs, architecture guides)
- Implement Cloud Architect Agent
  - Use shared RAG pipeline
    (get code from Member 3)
  - LLM recommends AWS/GCP services
  - Cost optimization suggestions
  - Scalability strategy
  - Rule based + LLM hybrid approach
  - Basic validation layer
- Test with sample queries
- Document all inputs and outputs
- Hand over to Member 1
```

Important Note for Everyone:

```
Member 3 starts first →
builds shared RAG pipeline →
shares with team →
everyone uses it in their agent

Build and test independently first
```

Please double-check responses.

```
- Document all inputs and outputs
- Hand over to Member 1
```

Important Note for Everyone:

```
Member 3 starts first →
builds shared RAG pipeline →
shares with team →
everyone uses it in their agent

Build and test independently first
then hand over to Member 1
for final integration
```

Tech Stack Everyone Needs:

```
Common   → Python, LangChain, OpenAI AF
Member 1 → LangGraph, MCP
Member 2 → Pandas, NumPy
Member 3 → FAISS/ChromaDB, PyPDF,
           Sentence Transformers
Member 4 → gets RAG from Member 3
```
